

PIC GROUP CHP UPGRADE PROJECTS Oklahoma & Minnesota

Atlanta based PIC Group has partnered with B&W Energy Services to execute critical services on two existing petrochemical facilities' cogeneration expansion projects in the U.S. Also known as CHP, or Combined Heat & Power, these projects are aimed at increasing efficiency and reducing carbon emissions at two major facilities in Rosemount, MN and Ponca City, OK, respectively.

The Flint Hills Resources Pine Bend refinery has played a major role in producing transportation fuels in the Midwest. The refinery is undergoing a major CHP project. B&W is designing and executing chemical cleaning, steam blows, air blows, AquaLazing and lube oil flushing services.

In Ponca City, OK, Continental Carbon produces professional-grade industrial rubber carbon black, tire carbon black and specialty carbon black. Their facility is also undergoing a major cogeneration upgrade. B&W will execute several pre-commissioning services including lube oil flushing, chemical cleaning, AquaLazing and steam blowing on the new cogeneration project.
