B&W Energy Services has been on call to provide pre-commissioning and cleaning services to Dominion Energy at their Millstone Nuclear Power Station in Waterford, CT as part of their fall outage.

Millstone Nuclear Facility produces enough electricity to power 2 million homes. The operation of the Millstone Nuclear Power Station produces over 1.5 billion dollars in annual economic benefits to the state, supports more than 3,900 jobs and generates the equivalent of over half the electricity consumed in Connecticut.

B&W worked for this facility two years ago on an emergency basis to remove hydroids from a cooling water system that is critical to the operation of the plant. This year, Dominion had a planned outage on a separate unit's cooling water system and B&W stood ready to offer our expertise on behalf of the facility.

This effort is part of B&W's transition to add our specialty services into the planned outage arena. It has enabled us to become a preferred vendor to Dominion as well as an established vendor to the nuclear industry, which requires the highest safety and environmental standards of any industry.
