

Morrow Repowering Project

Lamar County, Mississippi

In 2018, Morrow Cooperative Energy announced its plans to transform the R.D. Morrow, Sr. Generating Station, or Plant Morrow, to a natural gas-fired combined cycle plant after decades of Appalachian coal fueling. B&W had the opportunity to perform a full range of services on the Morrow Repowering project.

The facility, located in Lamar County in Miss., is focused on providing low-cost, efficient systems to maximize the generation of energy. The choice to move towards cleaner energy comes following the launch of an energy production facility by Morrow Cooperative Energy in 2017. B&W was able to perform a full range of services at Plant Morrow including oil flushing, air blowing, chemical cleaning and steam blowing. We also performed AquaLazing at the site, where we administered a series of advanced and high-pressure water jets to clean the facility's piping systems.
