

Fadhili Gas Project

Jubail, Saudi Arabia

B&W Energy Services is completing a wide scope of services for the Fadhili Gas Project in Saudi Arabia. The scope includes Aqualazing for the midstream gas processing plant, cleaning all compressor suction in lieu of a traditional chemical clean. In addition, B&W is cleaning the condensate and boiler feed water. Because the B&W team has a proven track record with Técnicas Reunidas in Kuwait, our team was chosen to uphold the same superior standards in Saudi Arabia. As of Spring 2019, the Fadhili project was falling behind schedule - this is another chance for B&W to come in and set the project back on track. B&W is replacing the chemical cleaning method with Aqualazing, returning the project to its initial schedule. The cleaning officially commenced in June of 2019 and will continue through the end of the year.
