

Pre-Commissioning Services From B&W Energy Services

Louisiana

B&W Energy Services is contracted to perform pre-commissioning cleaning services on a billion-dollar methanol plant. Our team is performing critical cleaning activities at the plant to facilitate a successful start-up, including AquaLazing, pigging, steam blowing, chemical cleaning and lube oil flushing.

Upon completion, the plant will have one of the lowest CO₂ emissions intensity profiles in the industry. The plant will utilize excess hydrogen from nearby steam reforming plants along with available, low-cost natural gas. The facility is set to produce 1.8 million tonnes of methanol per year. B&W is proud to be aiding organizations as they make moves to construct environmentally-friendly facilities like this one.
