

# Thailand Clean Fuel Project

B&W Energy Services was contracted to provide pre-commissioning services to a major clean fuel project in Thailand. Once complete, this project will increase the facility's crude oil refining capacity from 275,000bpd to 400,000bpd, while also improving its processes to meet modern high-quality fuel standards.

Our team is providing engineering and site-wide steam blowing services on an expansive network of steam systems as part of the expansion across several of the facility's new processing units.

B&W is grateful for the opportunity to contribute to this project within the refining sector and continue building on a growing track record of providing high-quality services in Southeast Asia.
